Aerosol retrieval from MODIS

What MODIS observes

Attributed to aerosol (AOD)

There are many different “algorithms” to retrieve aerosol from MODIS

1. **Dark Target (“DT” ocean and land; Levy, Mattoo, Munchak, Remer, Tanré, Kaufman)**
2. Deep Blue (“DB” desert and beyond; Hsu, Bettenhausen, Sayer,...)
3. MAIAC (coupled with land surface everywhere; Lyapustin, Wang, Korkin,...)
4. Ocean color/atmospheric correction (McClain, Ahmad, ...)
5. Etc (neural net, model assimilation, statistical, ...)
6. Your own algorithm (many groups around the world)

Outline

- Collection 6 (C6) in production
 - Differences from C5 (Level 2)
 - Some preliminary validation (for Aqua)
 - Terra versus Aqua and calibration
 - Level 3 protocol
 - Higher resolution 3 KM product
- Maintenance proposal accepted: Towards C7?
 - Corrections of urban surfaces
 - New Uncertainty products (per-pixel)
 - Consistency between Terra and Aqua, and continuation onto VIIRS
- Dark target web page

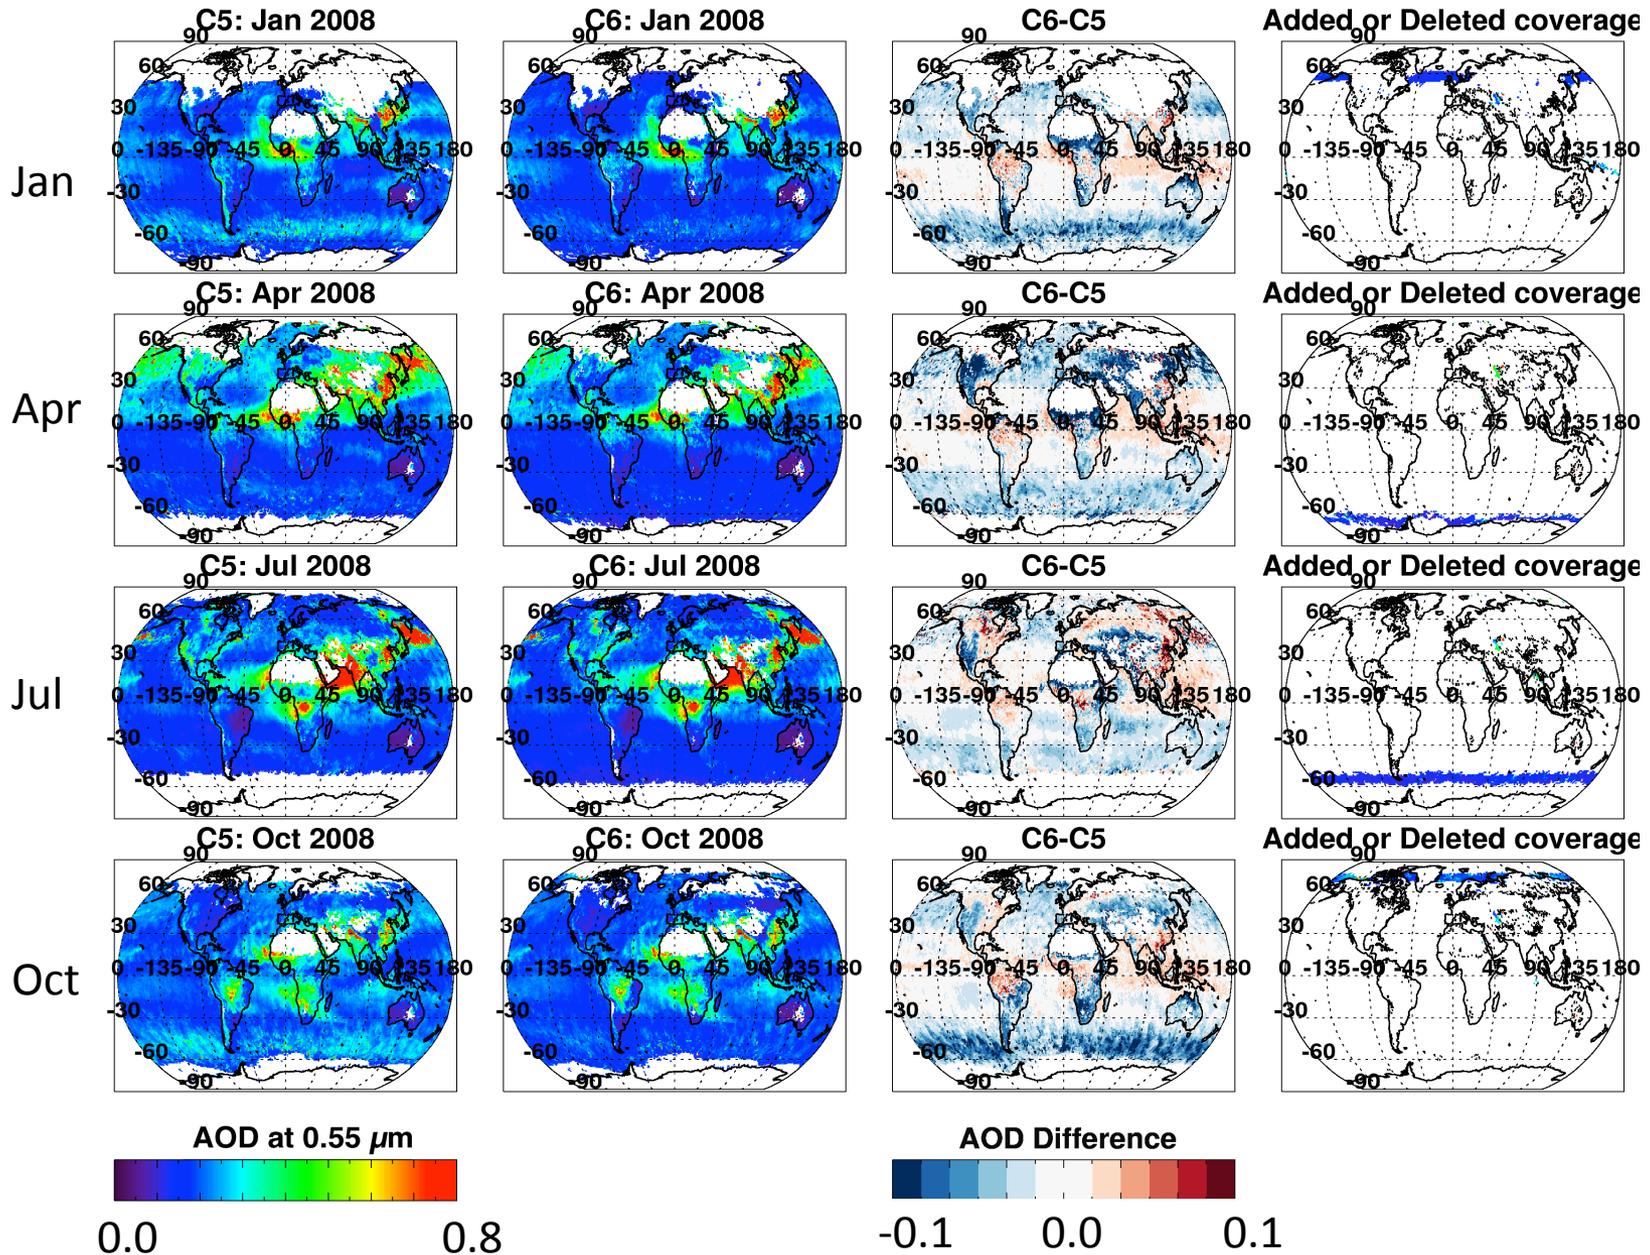

MODIS Collection 6: Introduction

Published in AMT

- Levy, R. C., Mattoo, S., Munchak, L. A., Remer, L. A., Sayer, A. M., Patadia, F., and Hsu, N. C.: The Collection 6 MODIS aerosol products over land and ocean, Atmos. Meas. Tech., 6, 2989-3034, doi:10.5194/amt-6-2989-2013, 2013.

<http://www.atmos-meas-tech.net/6/2989/2013/>

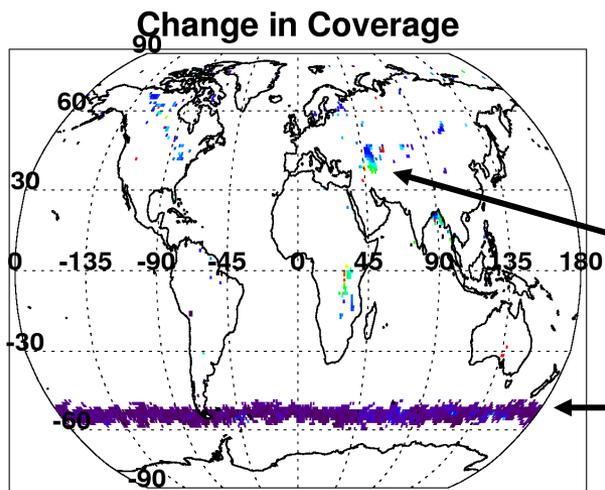

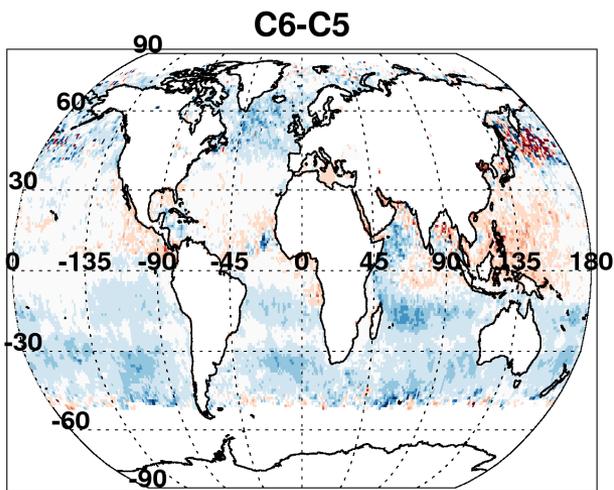

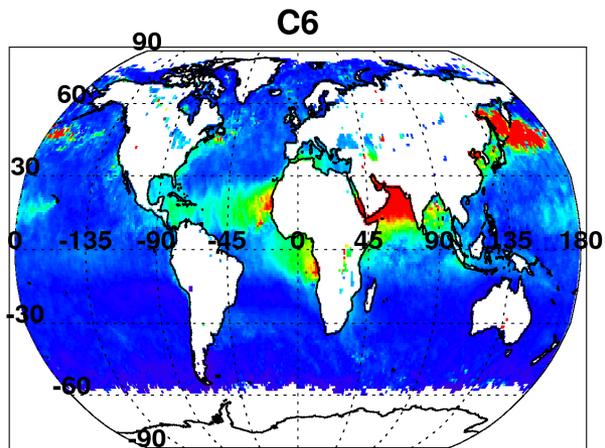

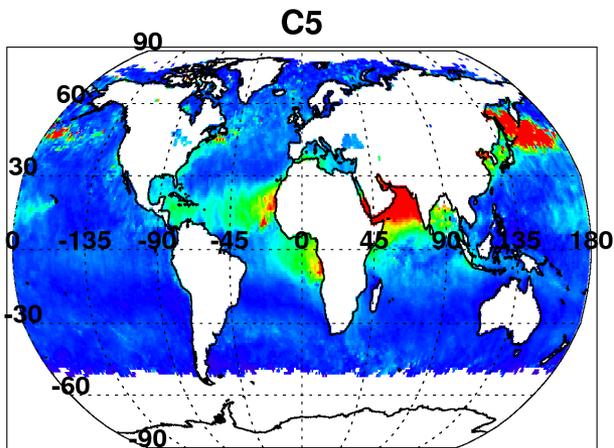

Overall changes (C6 vs C5): Aqua, 2008

Aerosol over ocean

Dark target over ocean

Overall changes to products (Aqua, Jul 2008)

- Overall decrease of AOD in mid-latitudes
- Strong decrease in “roaring 40s” (even stronger in other months)
- Overall increase in tropics

- “New” coverage over inland lakes
- Increase in coverage toward poles

AOD Difference

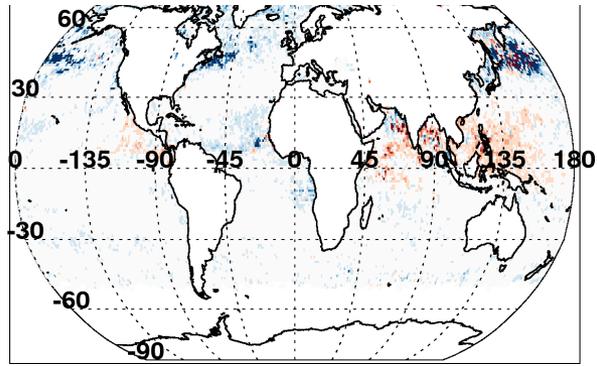

AOD at 550 nm

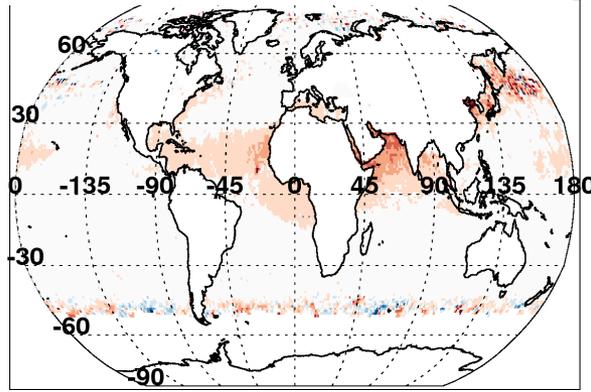

Why the changes?

C6-C5 ocean: Due to many incremental changes (Aqua, July 2008)

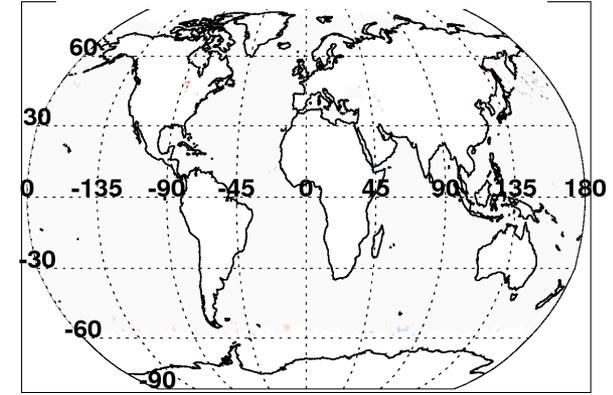

New reflectance, geo-location inputs, Wisconsin cloud mask

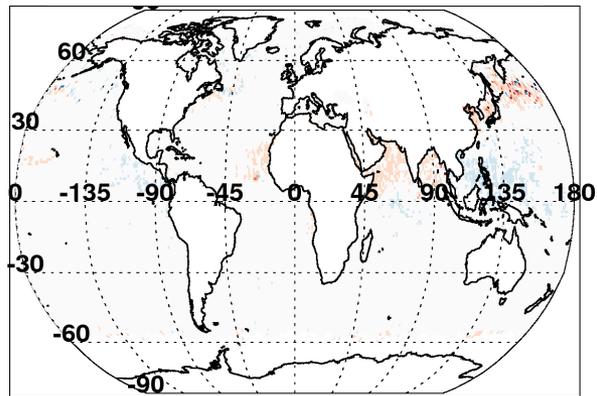

Updated radiative transfer

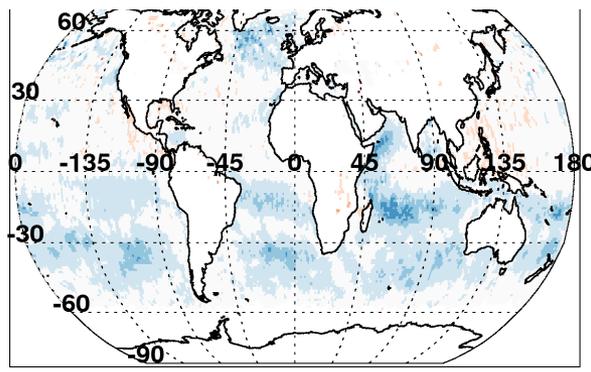

Re-define land and sea

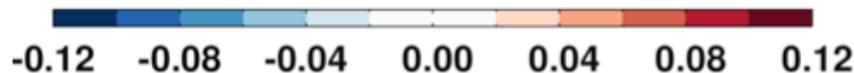

Improved cloud mask

Account for wind speed impact on surface

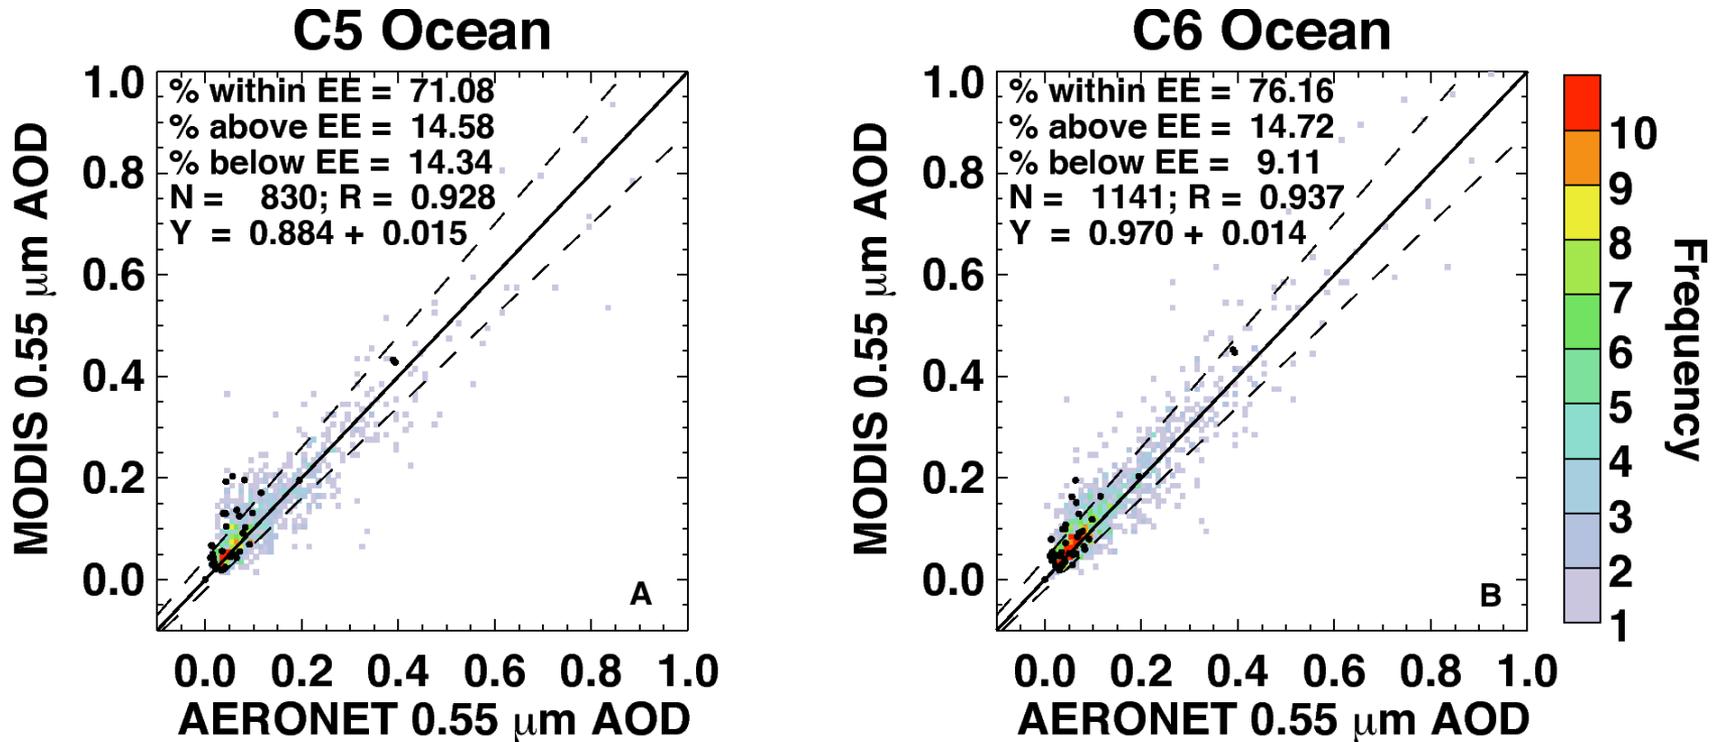

AOD Difference

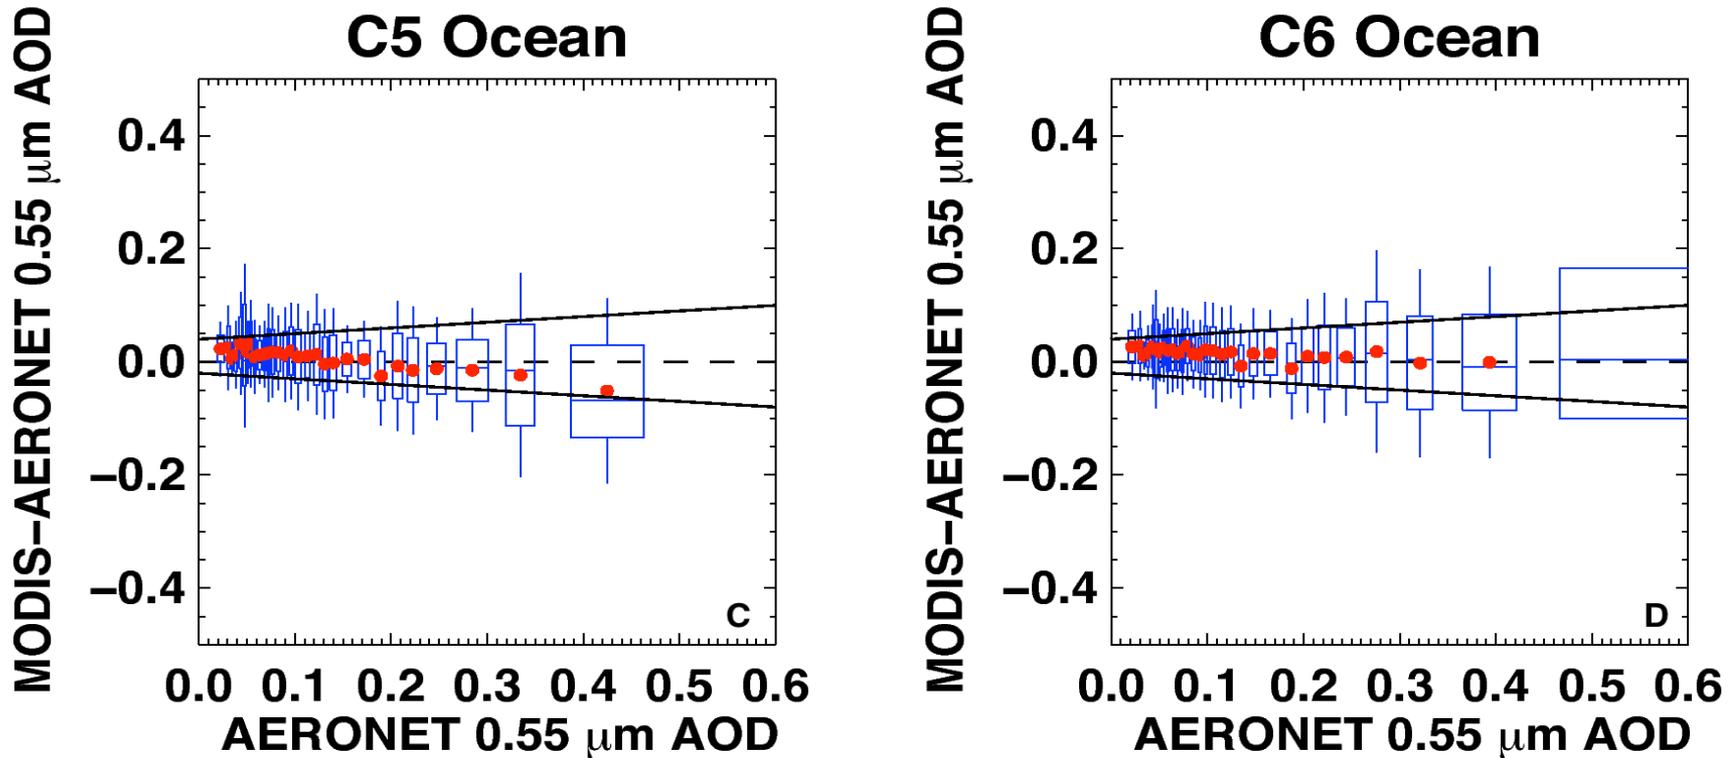

- Also changed “Quality Assurance” Filtering
- Changed aerosol definitions of land and sea
- Etc

Comparison with AERONET and MAN

- Aqua for 8 months (Jan + July, 2003, 2008 and 2010; Apr + Oct 2008).
- Overall, not much change over ocean (slope, intercept, correlation)
- But 30% more valid points to compare with (1141 versus 830).
- AERONET are gray and colored, MAN are black dots

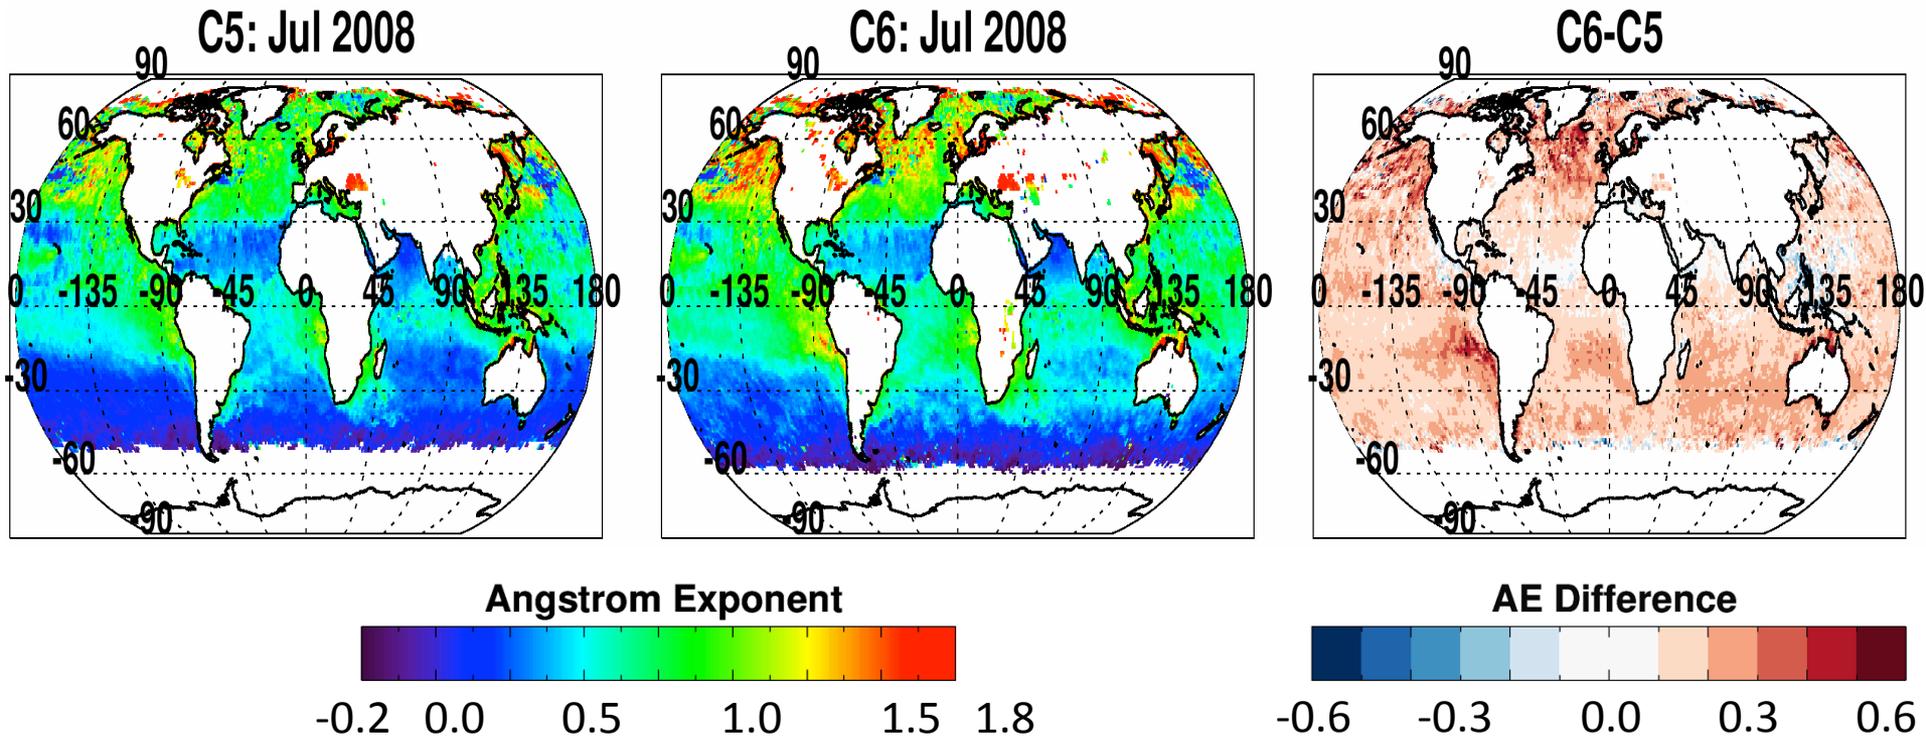

Better way to see MODIS improvement

- MODIS error (MODIS–AERONET) versus AERONET; zero “error” is dashed line
- Boxes represent middle 67% of each dataset, whiskers are middle 95% of MODIS-AERONET
- Solid lines are “expected error” (EE) envelope; note asymmetry (new definition for C6).
- Note that in C6, that the MODIS error is within EE for nearly all bins of AOD
- C5 EE = $\pm(0.03 + 5\%)$. C6 EE = $(-0.02 - 10\%), (+0.04 + 10\%)$
- Less overall “bias” in C6.

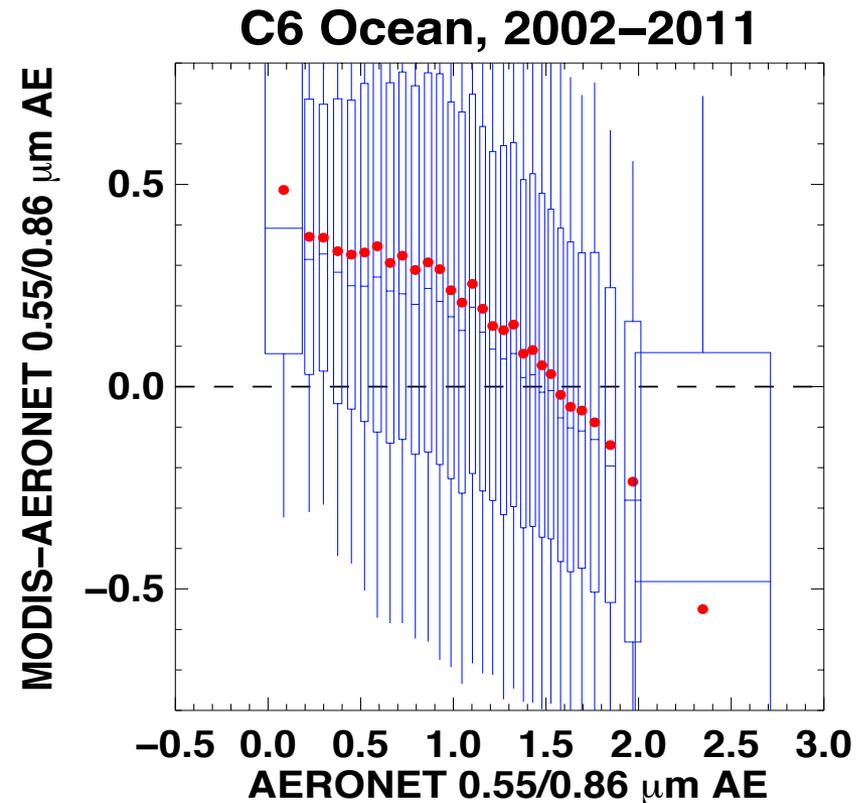

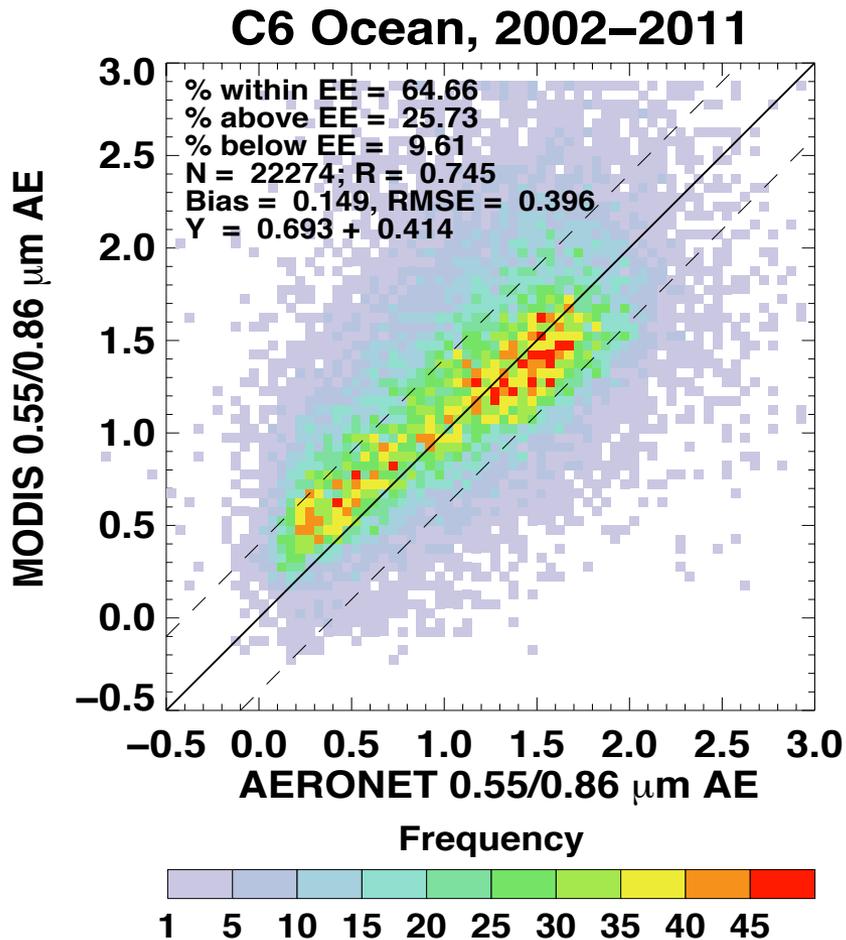

See updates (10 years of Aqua) on L. Munchak’s poster!

Impact on Ångström Exponent

- AE calculated from 0.55 vs 0.86 μm
- Comparison is for Aqua
- Overall increase of global AE (+0.18).

Reasonable validation of AE within ± 0.4

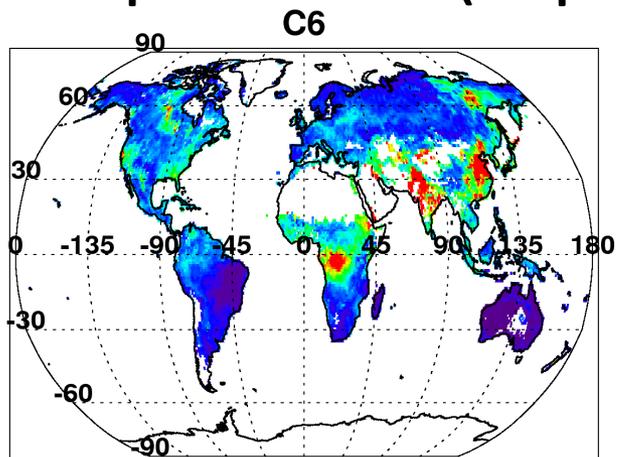

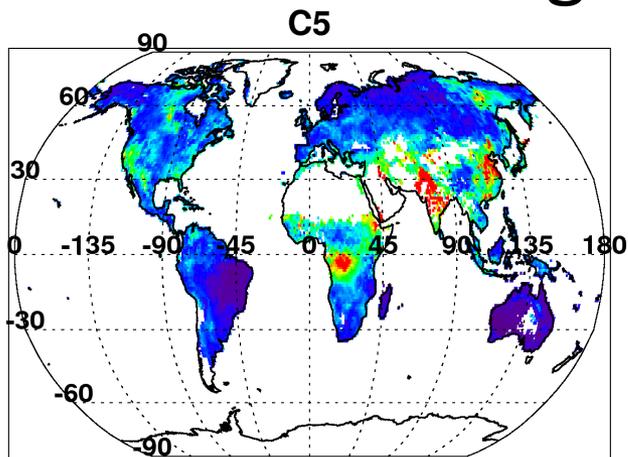

MODIS “range” is less than AERONET

See L. Munchak’s poster! ₃

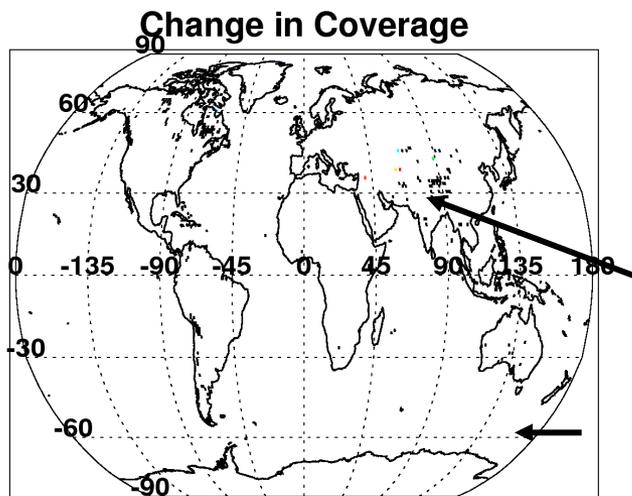

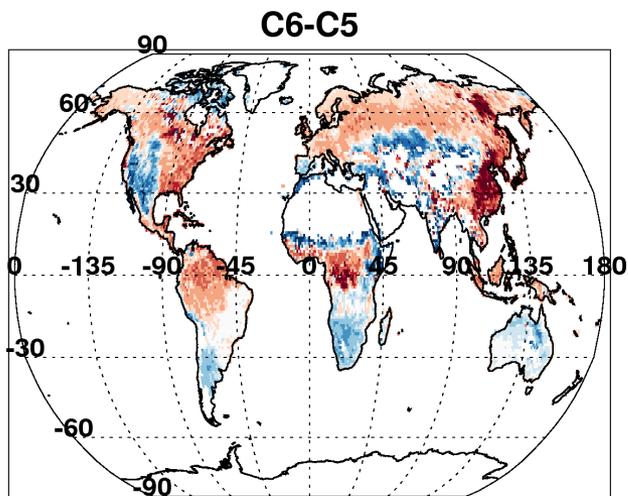

Aerosol over land

Dark target over land

Overall changes to products (Aqua, Jul 2008)

- Overall decrease of AOD in semi-arid
- Overall increase over vegetation
- Strong increase over Eastern Asia

- Slight change in coverage here and there

AOD Difference

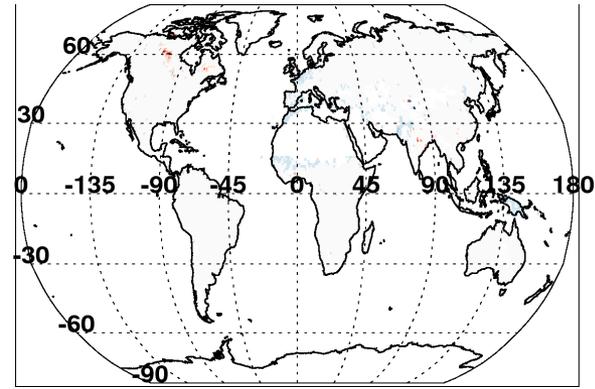

AOD at 550 nm

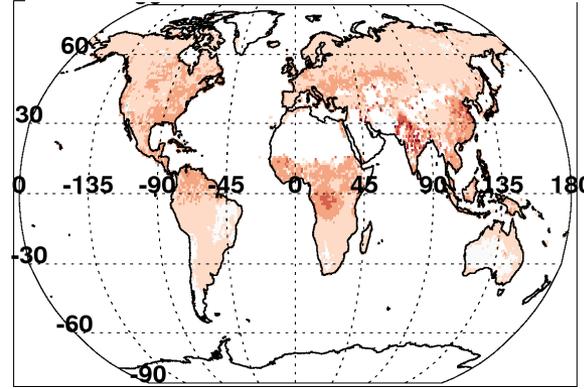

Why the changes?

C6-C5 land: Due to many incremental changes (Aqua, July 2008)

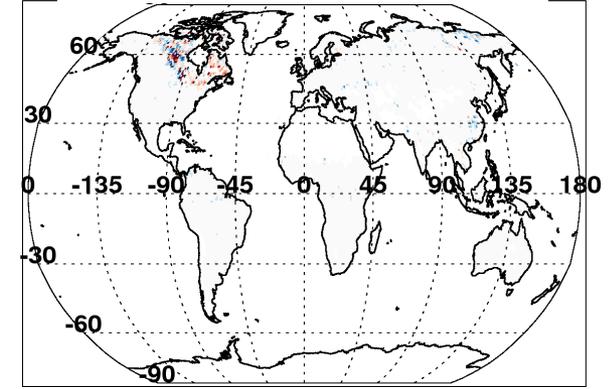

New reflectance and geo-location inputs

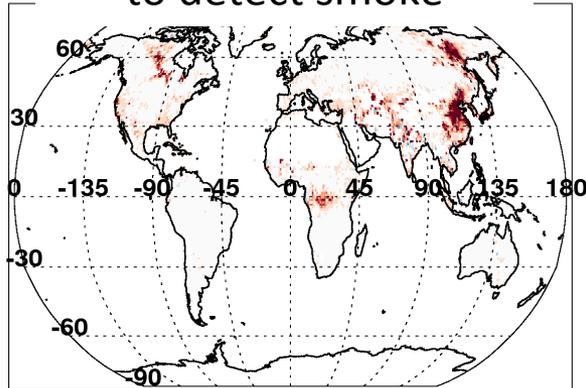

Updated radiative transfer

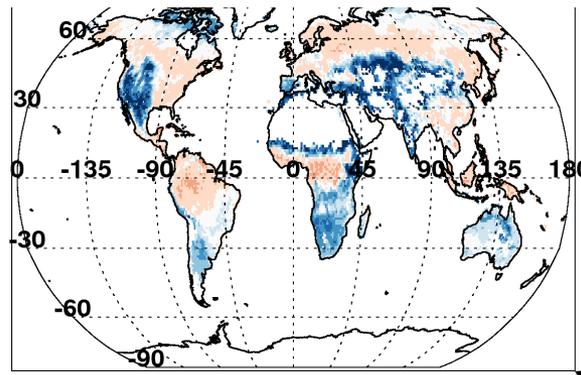

Re-define land and sea

Improved cloud mask to detect smoke

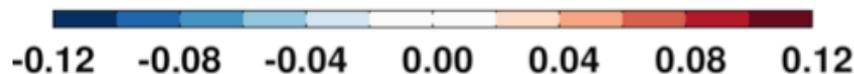

Fixed surface reflectance dependence on TOA NDVI

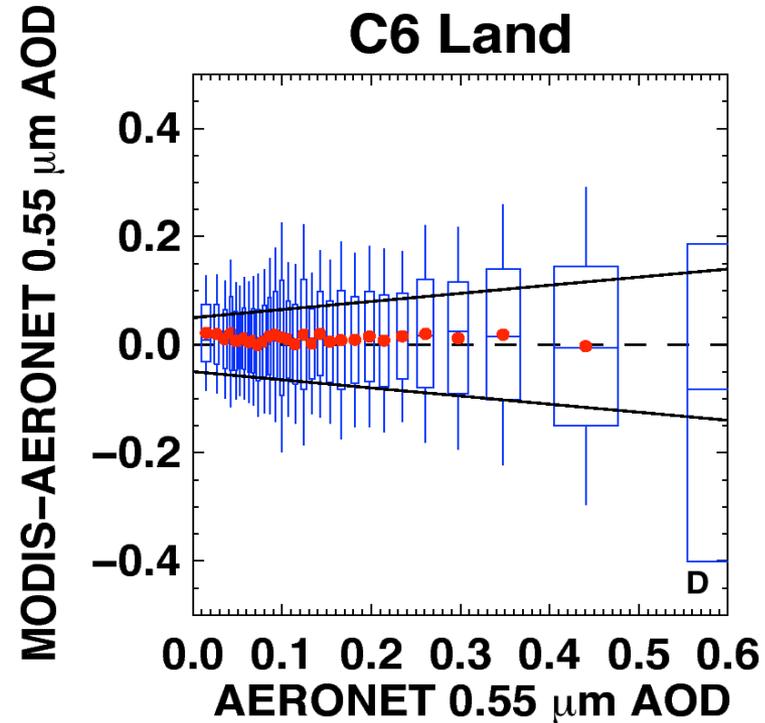

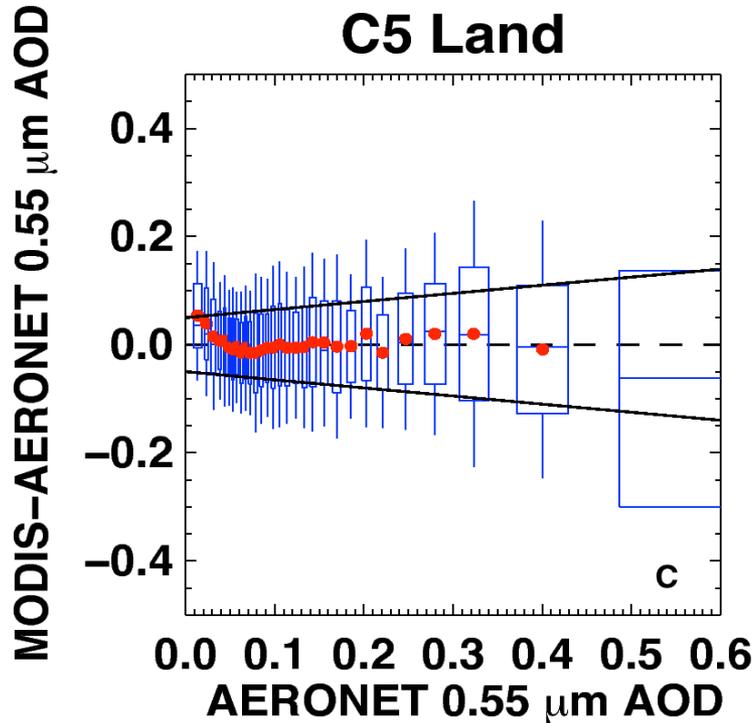

- Also changed “Quality Assurance” Filtering
- Changed aerosol definitions of land and sea
- Etc

AOD Difference

This was a major bug!

Preliminary comparison with AERONET (8 months of Aqua data)

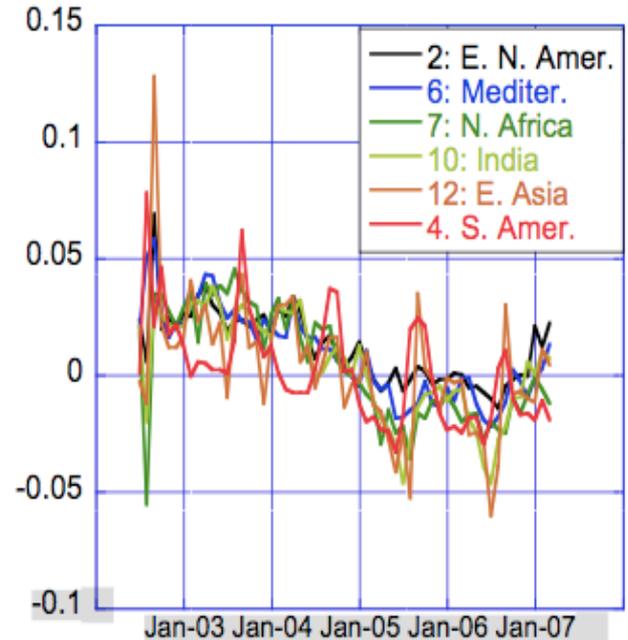

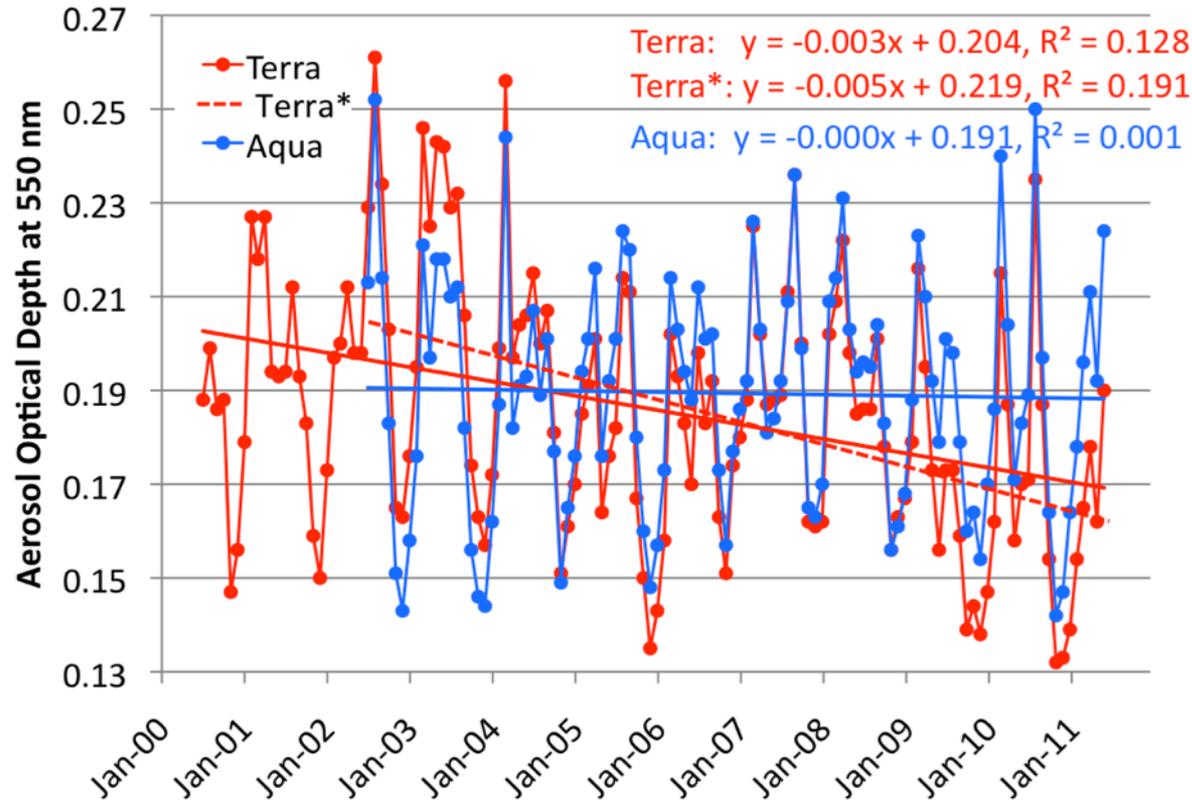

- MODIS error (MODIS-AERONET) versus AERONET; zero “error” is dashed line
- Boxes are middle 67% of dataset, whiskers are middle 95% of MODIS-AERONET
- Solid lines are “expected error” (EE) envelope; no asymmetry
- C6 MODIS error is within EE for nearly all bins of AOD (even at low values)
- C5 EE = $\pm(0.05 + 15\%)$. Keep definition for C6.

See updates (10 years of Aqua) on L. Munchak’s poster!

Terra versus Aqua

If we had used Collection 5

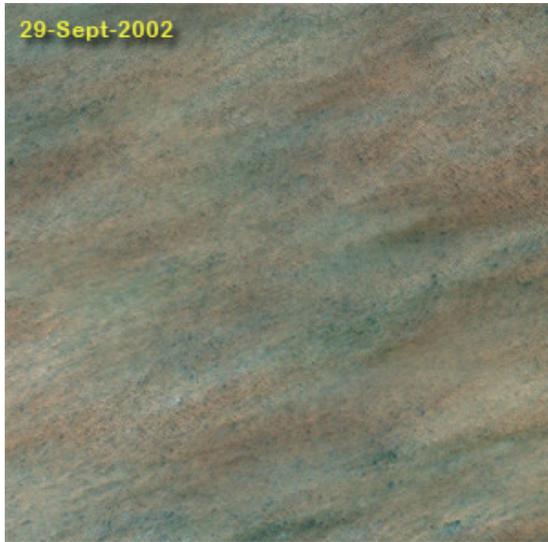

MODIS AOD Monthly Mean - Land Only

- Over land, **Terra** decreases (-0.04/decade), **Aqua** constant
- **Terra** / **Aqua** divergence is the same everywhere on the globe!
- In NH, observations are 1.5 hours apart, while SH are 4.5 hours
- So, probably not due to diurnal cycle of aerosol

Why? MODIS reflectance over desert sites: C5

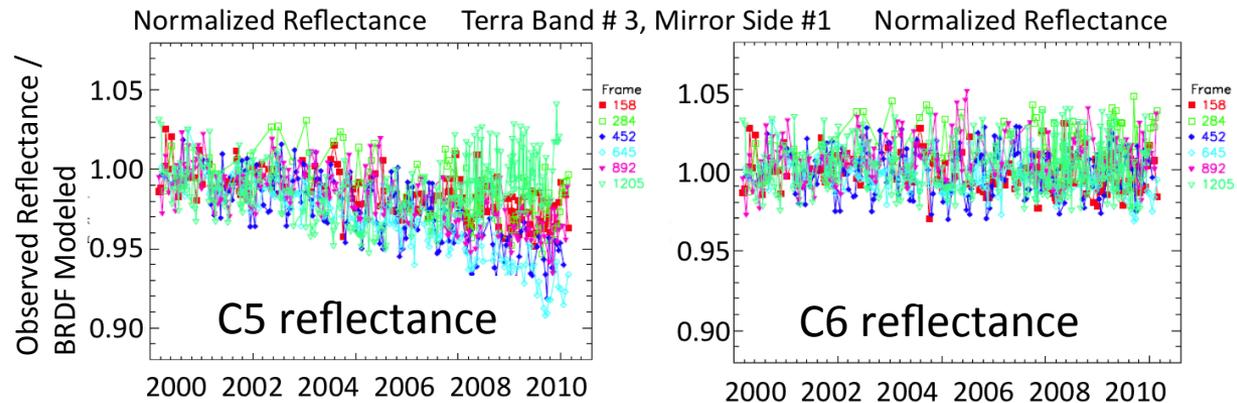

desert test sites

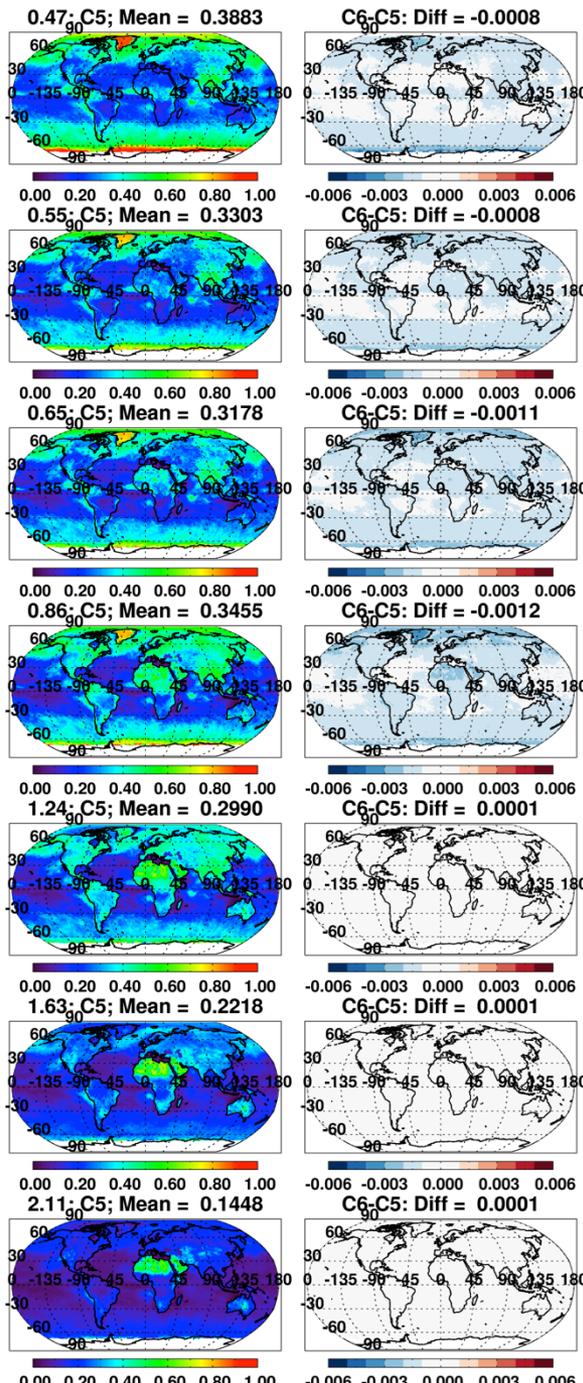

MCST (Sun, Xiong et al)

- (1) Collect clear-sky MODIS data over desert sites
- (2) Develop site-specific BRDF from first 3 years of mission
- (3) Over time, compare “observed” reflectance with BRDF modeled reflectance, for different view angles

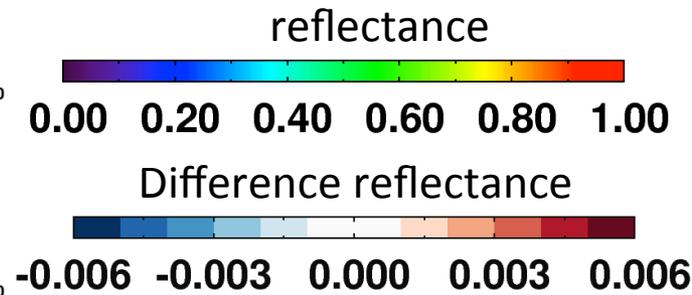

- (4) Characterize and de-trend MODIS observations
- (5) Create a new L1B dataset for C6.

L1B Reflectance: Jul 2008 Aqua

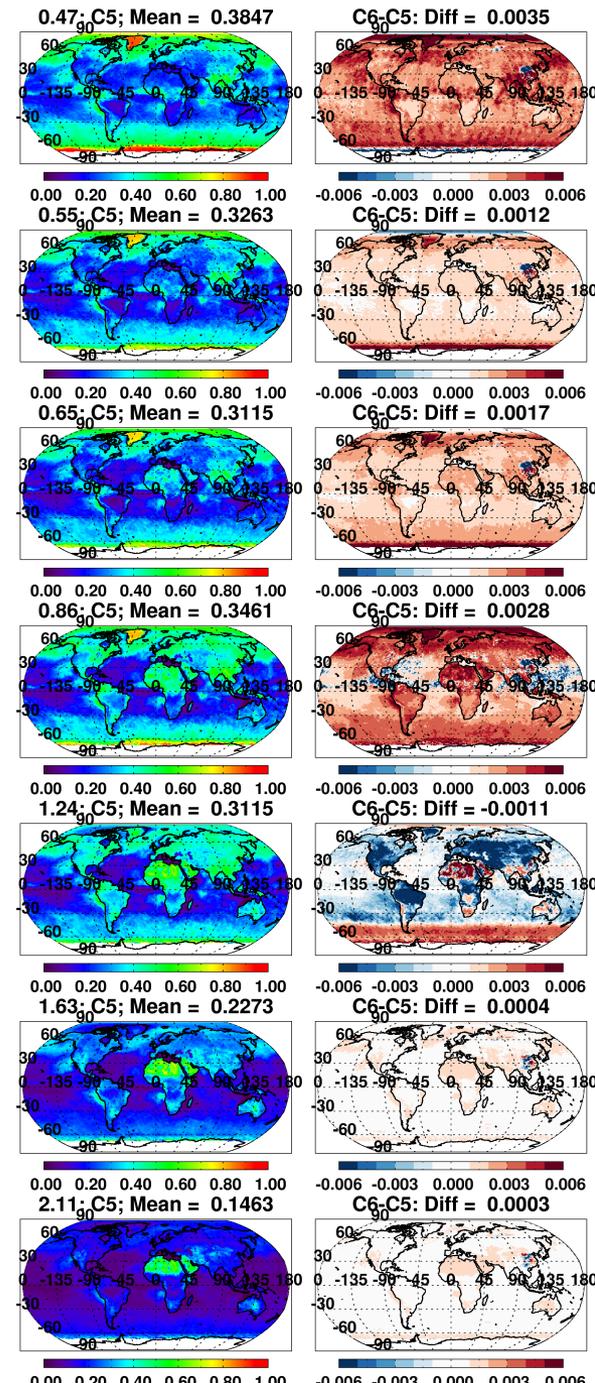

Impact to “observed” reflectance

- “Global” Aqua changes in visible bands by -0.001 or less
- “Global” Terra changes in visible bands by +0.002 or more
- Overall Aqua changes are relatively stable, but Terra’s changes vary over time.

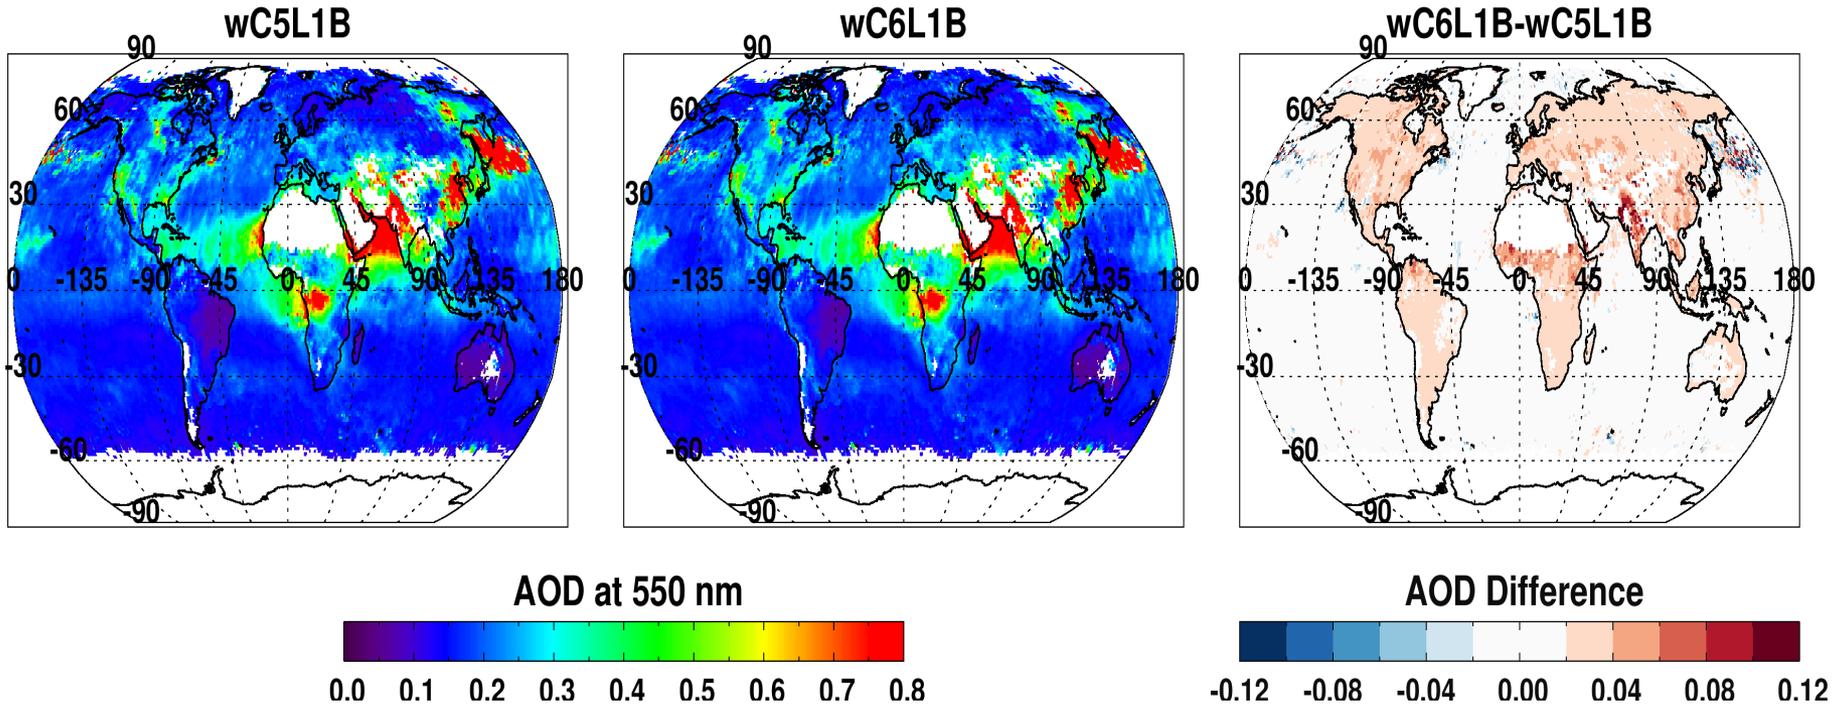

L1B Reflectance: Jul 2008 Terra

Impact of New Terra calibration

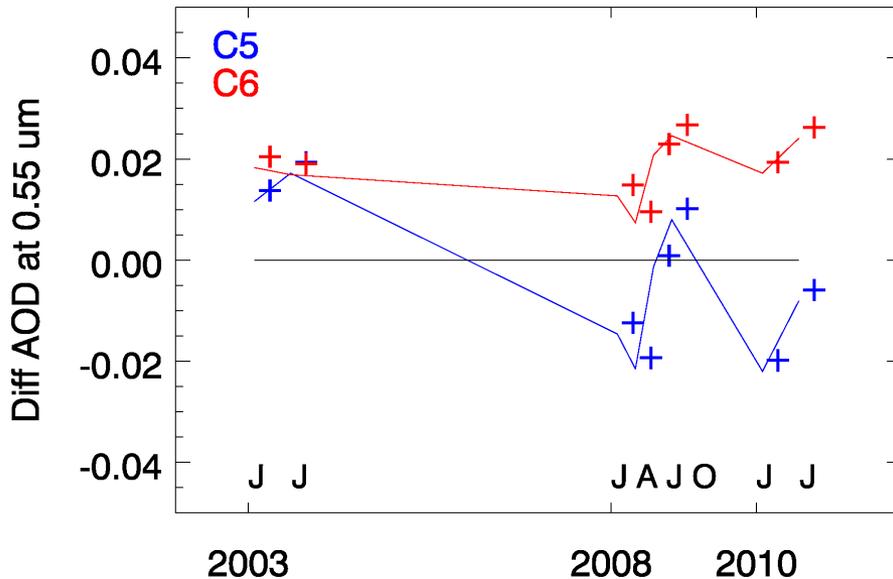

Jul 2008: Terra

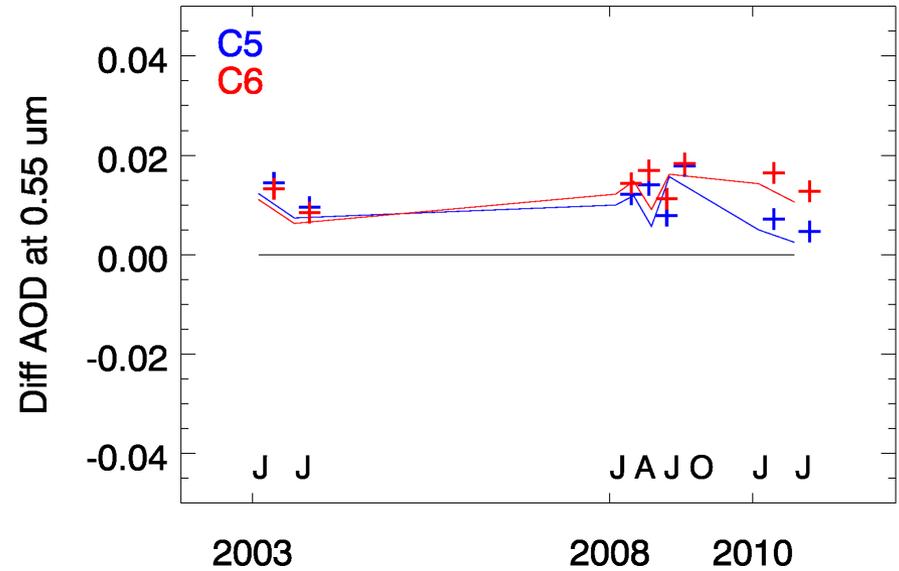

- Big changes to blue and red bands
- Biggest impacts over land
 - Global increase by 0.02 (for this particular month). 10% of global mean!
- Smaller impacts over ocean
 - Global increase by 0.004 (for this particular month)

Impact of new calibration on trend of Terra-Aqua AOD

Global mean AOD Terra-Aqua: land

Global mean AOD Terra-Aqua: ocean

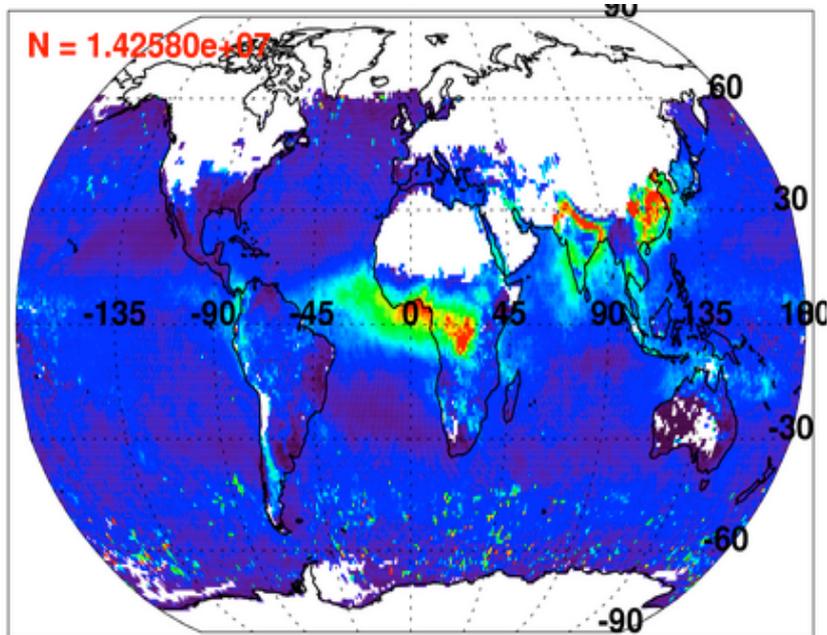

- 8 months processed with same dark-target aerosol algorithms
- Terra now more “in sync” with Aqua time series
- **New calibration → Terra/Aqua divergence removed for C6!**
- (Terra-Aqua) offset remains 0.02 (land) and 0.015 (ocean)

What else for C6 Level 2?

- Diagnostic SDSs (wind speed, integer QAC, topographic elevation, etc)
- “Cloud mask”, “distance to nearest cloud”
- Changes to SDS names

Deep Blue/Dark Target Merge:

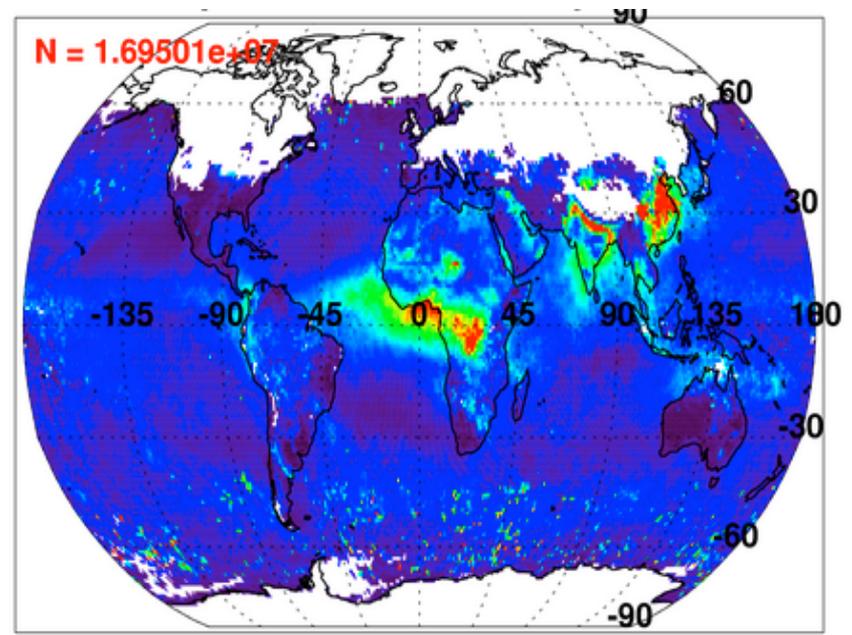

Dark Target AOD

AOD at 550 nm

DeepDark AOD

AOD at 550 nm

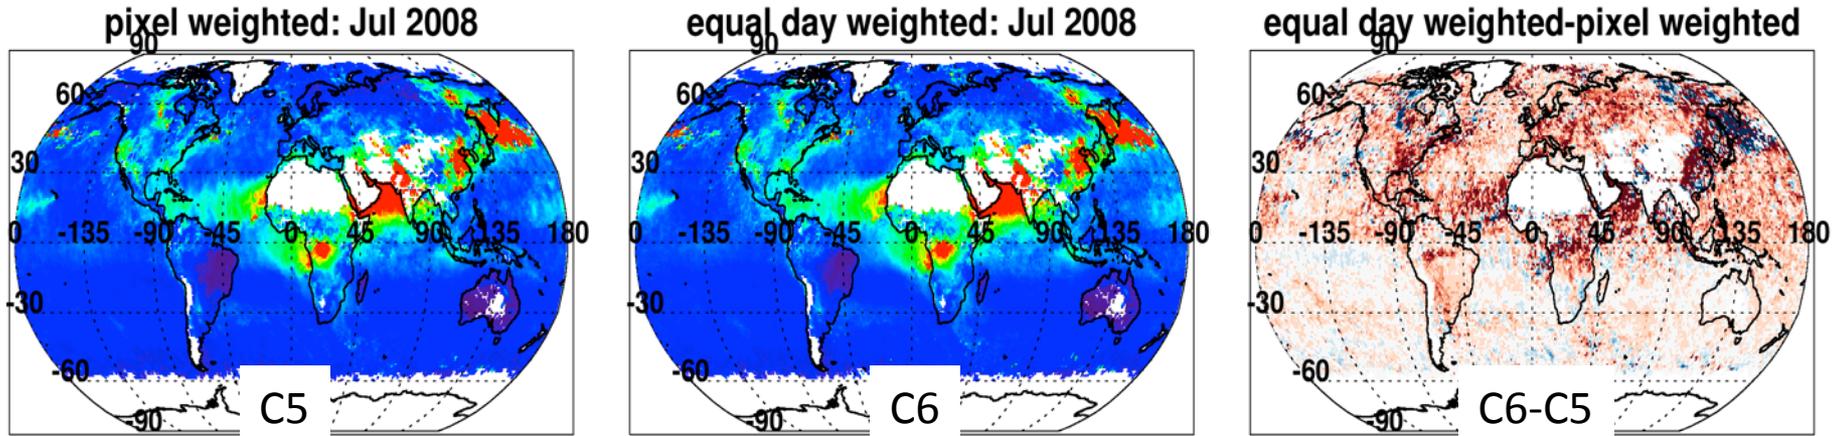

Merging deep blue & dark target produces best global coverage

- Deep blue is land-only; need dark target for oceans
- Deep blue introduces coverage over Australian outback, Sahara desert and Arabian peninsula
- Still no coverage over snow (see: most of Northern Hemisphere).

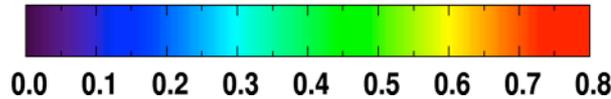

LOOKS REASONABLE, BUT NOT VALIDATED YET!!!!

Beyond MxD04_L2

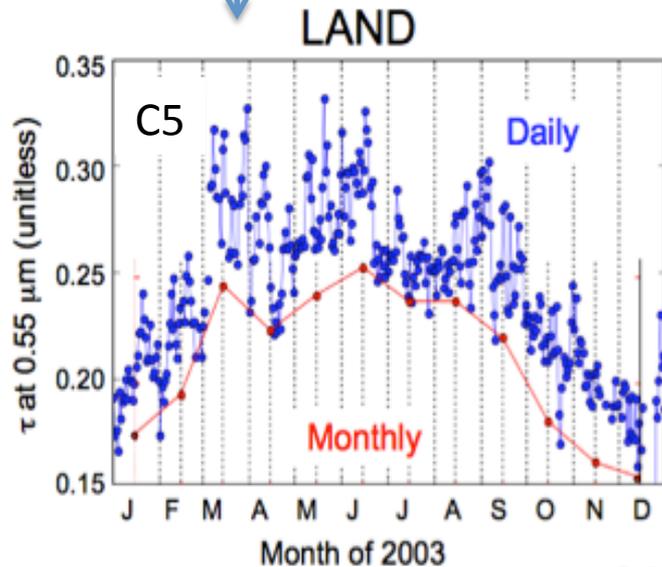

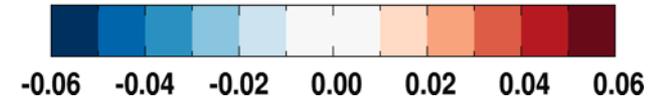

Changes to Level 3 (MxD08_M3)

AOD at 550 nm

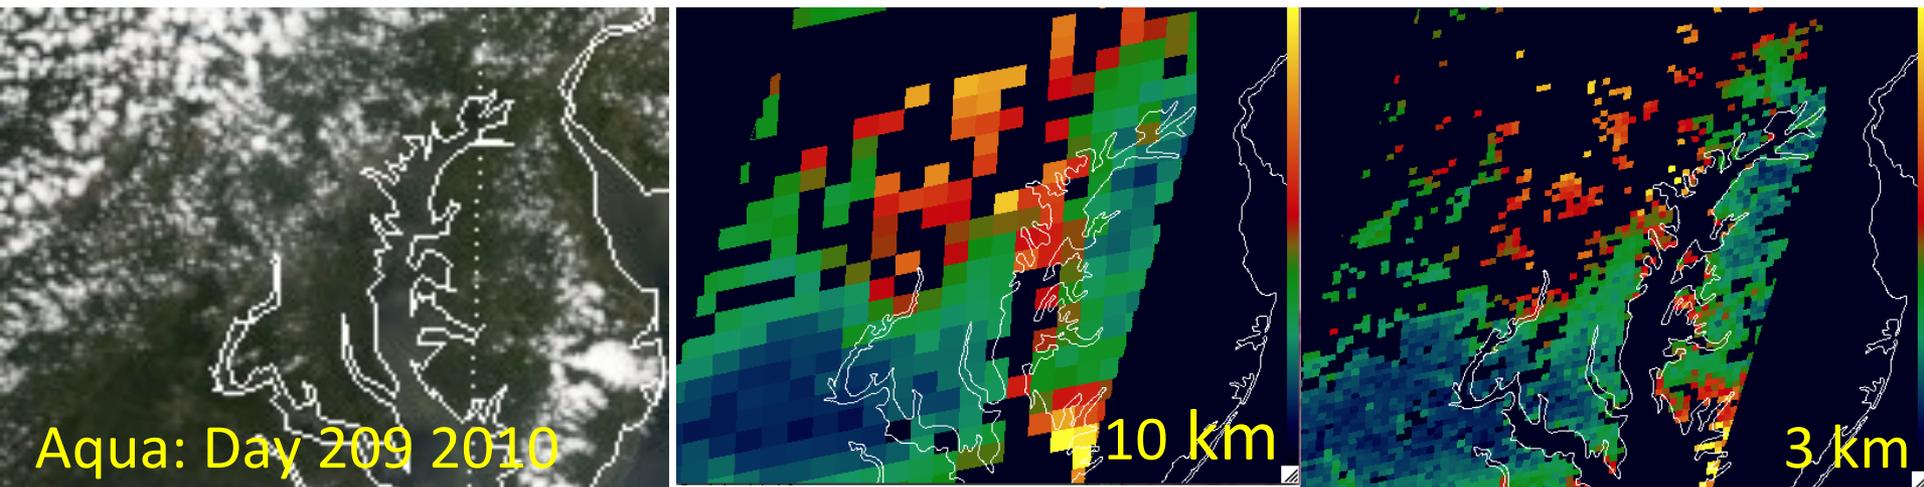

AOD Difference

- In C5, averaging daily data did not look like monthly data (left, from Giovanni web application)
- C5 monthly was “pixel weighted”. A day with 100 retrieved pixels was worth 10 times more than one with 10. It was clear-sky biased.
- C6 monthly is “equal day” weighted. If at least five pixels in a day, than that day counts.
- → Increases monthly mean AOD over land, and ocean. Less clear sky biased?

MxD04_3K (a new 3 km aerosol product)

- Driven by air quality community,
- Maybe also some applications to aerosol/clouds.
- Currently Dark target only

Munchak, L., R.C. Levy, S. Mattoo, L.A. Remer, B.N. Holben, J.S. Schafer, C.A. Hostetler, and R.A. Ferrare (2013). MODIS 3km Aerosol Product: applications over land in an urban/suburban region *Atmos. Meas. Tech*, 6, 1747-1759, doi:10.5194/amt-6-1747-2013

MxDATML2 product

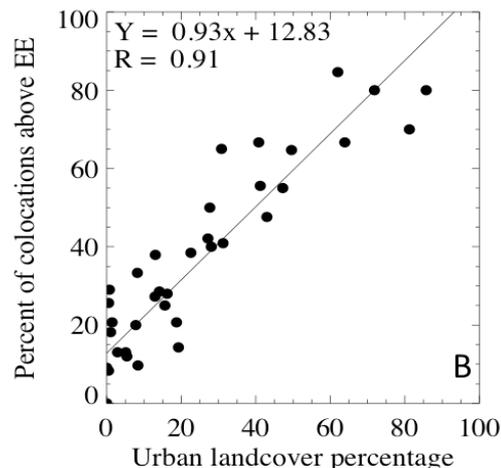

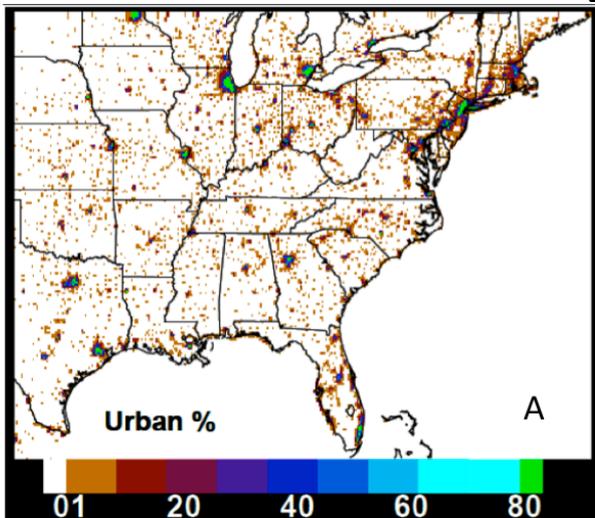

- Combines the “best of” MxD04_L2 (10 km) aerosol, MxD06_L2 (5 km) cloud products, and other atmosphere prods
- For joint analyses of aerosols and clouds (at granule level)

Platnick, King, Hubanks,..

Towards collection 7

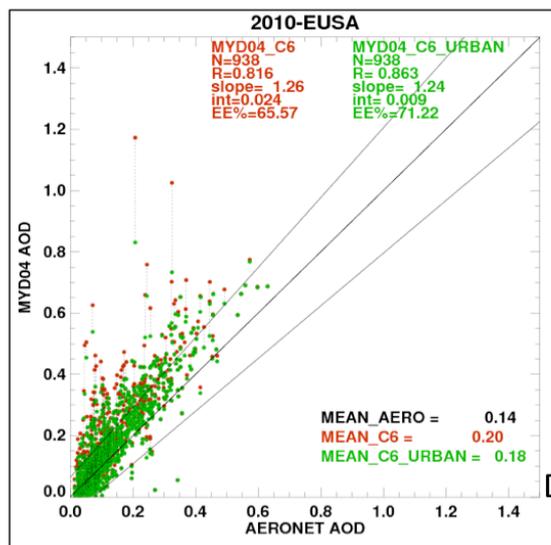

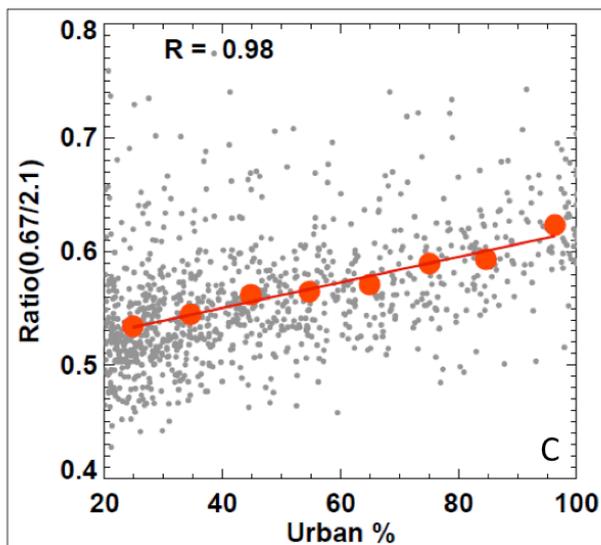

- Accounting for bias over urban areas
- Determining per-retrieval uncertainty
- Residual calibration/polarization errors

Accounting for Urban bias

More urban -->
higher bias

Over MD/DC
during DISCOVER-
AQ

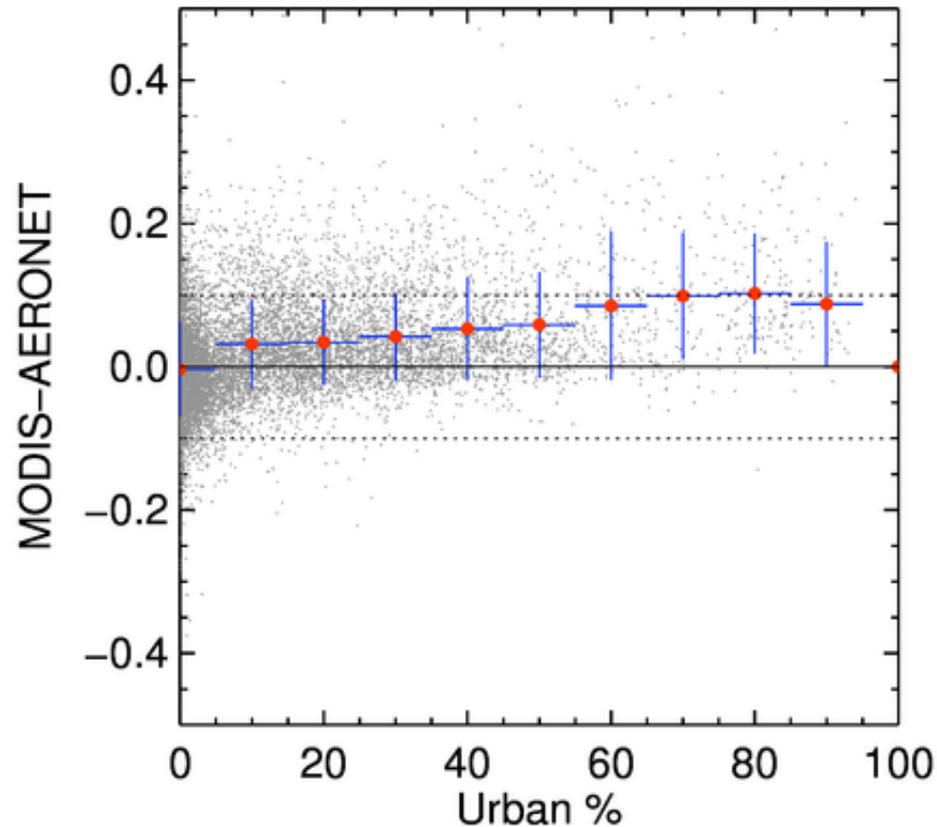

Looking at
possible
corrections

Applied to E-USA
over 2010

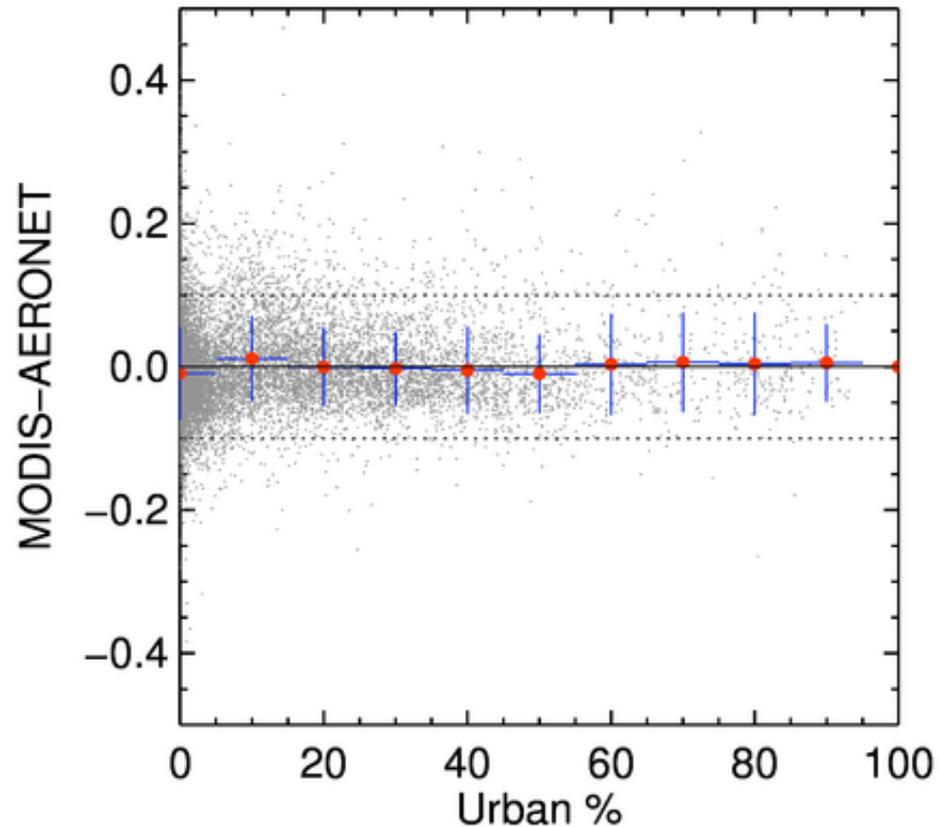

- Can we reduce artificial urban hotspots without impacting surrounding rural areas?

United States: 2002-2010 Aqua

C6 Retrieval

Retrieval using Urban fix

At least over the U.S, we can correct the positive urban bias.

See Pawan Gupta's poster!

Characterizing uncertainty in Aerosol Optical Depth Retrieval

There are **two** broad error sources :

1. Measurement / Input Uncertainties

- Calibration Uncertainty [**1 – 2%**]
- Standard Deviation of reflectance in 10 x 10 km retrieval box [**1 – 2%**]
- Uncertainty in the Ancillary data used for atmospheric correction [**~3.5%**]
- Cloud contamination [τ Bias of **+0.04** (Terra) and **+0.01** (Aqua), *Hyer et al., 2011*]
- Snow contamination

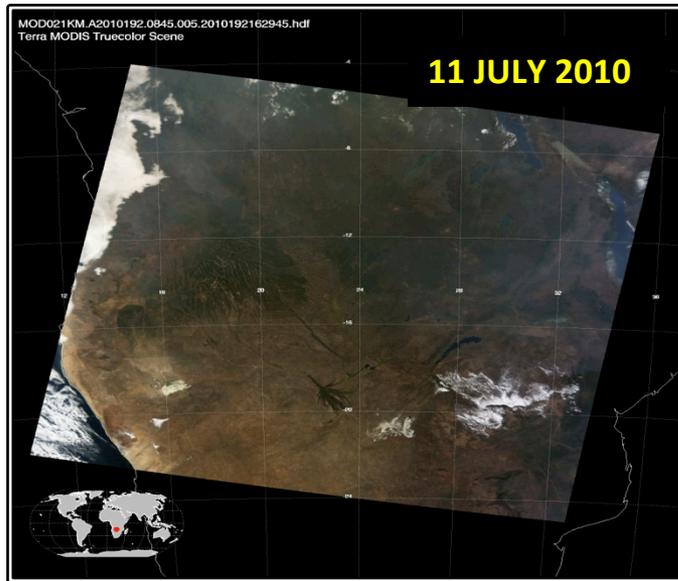

2. Retrieval Assumptions

- Surface reflectance
- Aerosol models

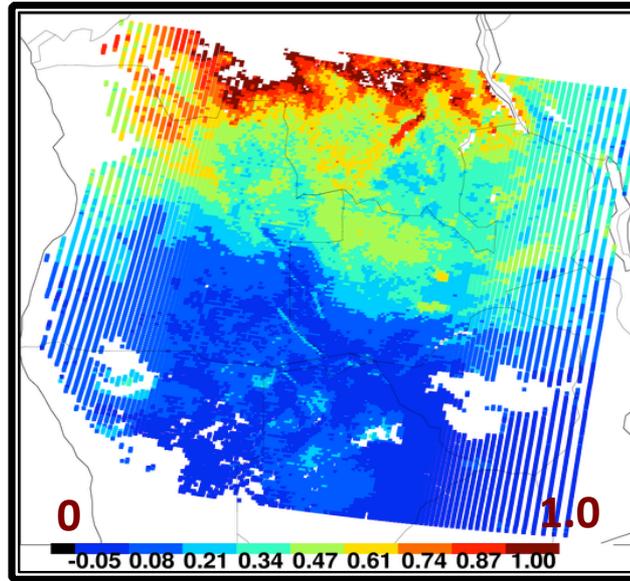

See Falguni Patadia's poster!

Example : Uncertainty in AOD retrieval from Reflectance Standard Deviation

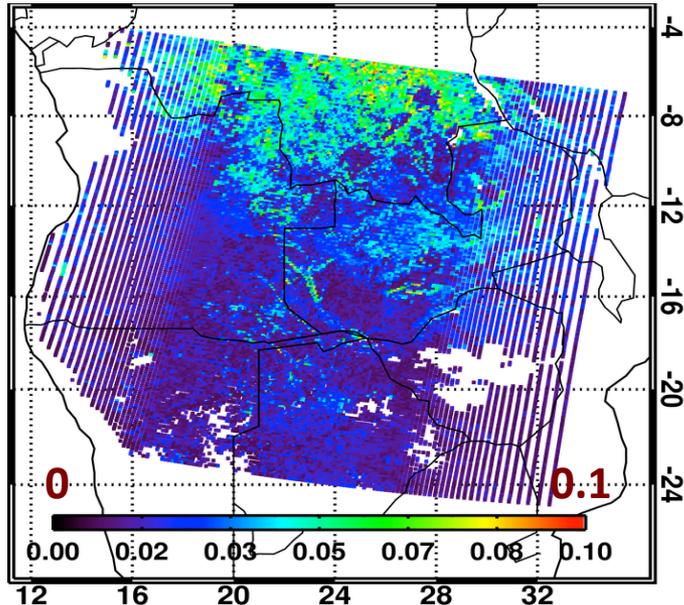

MODIS L1B RGB Image over Central Africa

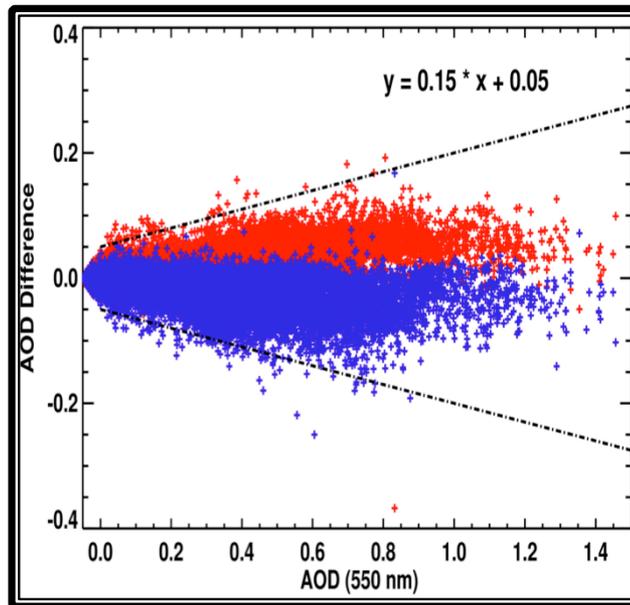

MODIS AOD (554 nm)

Absolute Error in AOD

Absolute AOD Error Relative to AOD

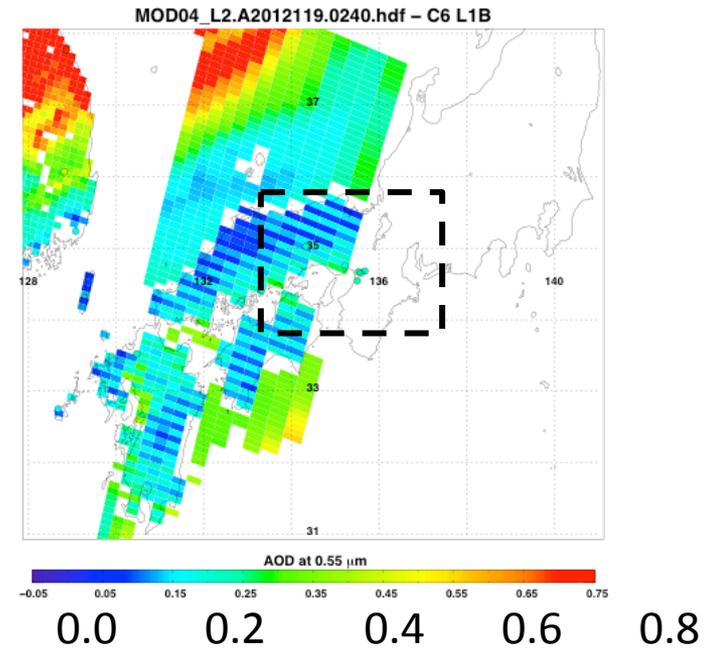

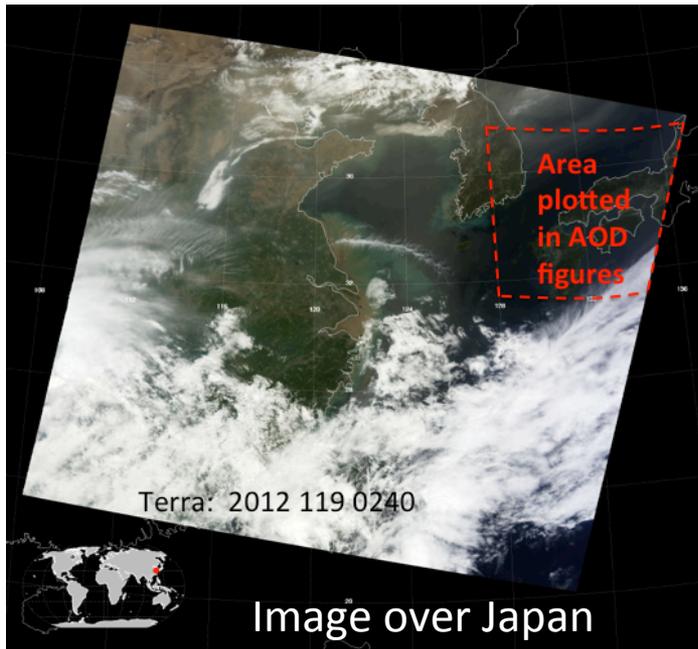

AOD differences due to standard deviation of reflectance within 10 X 10 km box

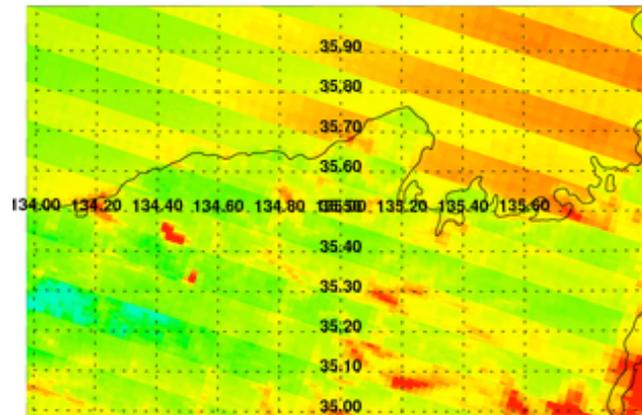

Compared to EE envelope

See Falguni's poster!

Residual calibration/polarization errors

Blue reflectance

Hear Alexei Lyapustin's talk!

- Dealing with “striping” of 0.1 AOD in recent (post 2012) Terra data
- Seems to be a mirror polarization sensitivity issue.

Dark-target aerosol retrieval: Beyond MODIS

VIIRS versus MODIS

Orbit: 825 km (vs 705 km), sun-synchronous, over same point every 16 days

Equator crossing: 13:30 on Suomi-NPP, since 2012 (versus on Aqua since 2002)

Swath: 3050 km (vs 2030 km)

Spectral Range: 0.412-12.2 μ m (22 bands versus 36 bands)

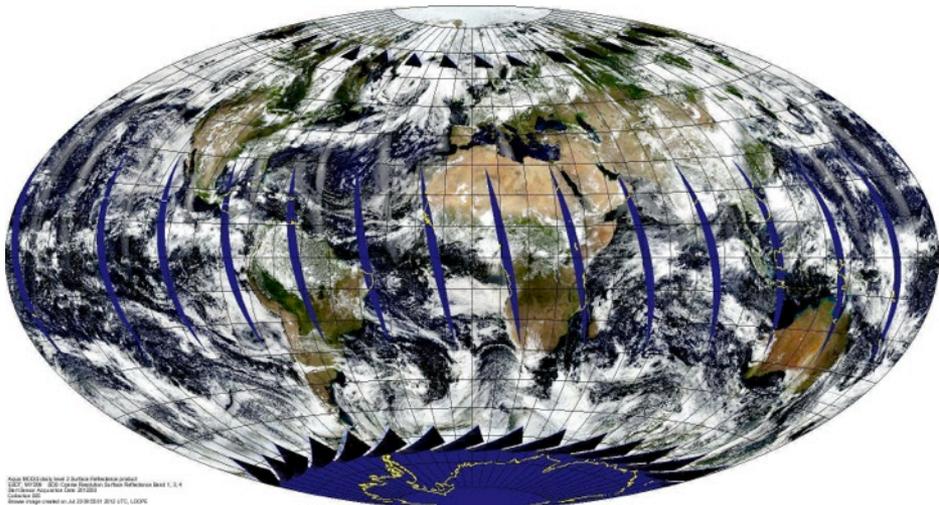

Spatial Resolution: 375m (5 bands) 750m (17 bands): versus 250m/500m/1km

Wavelength bands (nm) used for DT aerosol retrieval: 482 (466), 551 (553) 671 (645), 861 (855), 2257 (2113) \rightarrow differences in Rayleigh optical depth, surface optics, gas absorption.

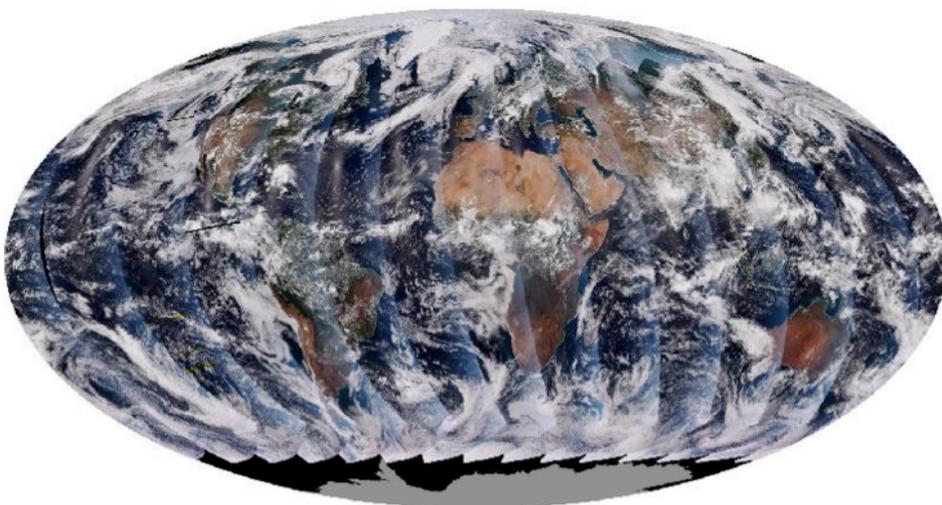

Aerosol Retrieval: Created and maintained by scientists partnered with NOAA (NASA), with a strategy of maximizing environmental data record - EDR (climate data record – CDR)

ALSO: Different cloud masks, different aggregation techniques, different pixel selections.

Aqua (13:30 Local Time, Ascending)

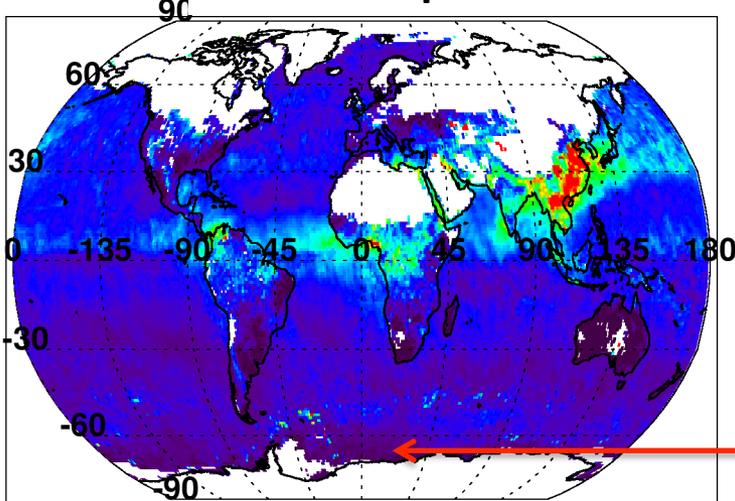

Suomi-NPP (13:30 Local Time, Ascending);

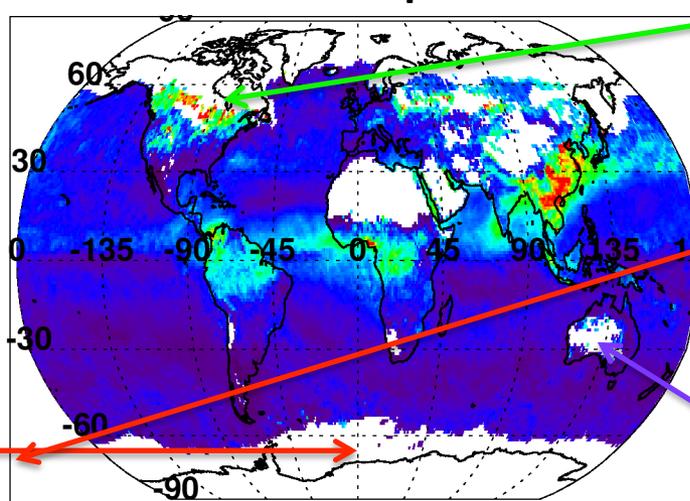

Different instrument, resolution, sampling, cloud masking, algorithms, etc.
Will VIIRS “continue” the MODIS aerosol data record?

ONE RETRIEVAL ALGORITHM: Consistent Across Platforms

MODIS C6 product

NOAA-VIIRS product

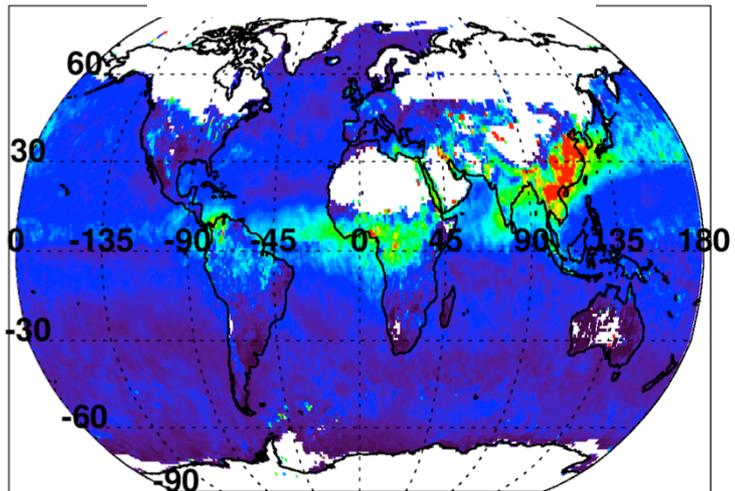

Different snow thresholds?

Different SZA thresholds

?

MODIS-like on VIIRS

AOD at 550 nm

Still different, but much more similar over both land and ocean

We make VIIRS consistent with MODIS.
(we learned from Terra vs Aqua)

MODIS-like algorithm on ANY sensor!

For climate continuity

- MODIS
- VIIRS
- MAS/E-MAS/AMS (Airborne spectrometers and historical experiment data)
- International sensors
- Future sensors (e.g. PACE / ACE) as a baseline for testing new ideas

Many details, but can be done!

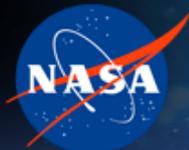

Okay: summary time

Summary (C6)

- There are many ways to retrieve aerosol properties from MODIS, and there is more than one set of algorithms/products
- Dark-target algorithm/products updated for C6
- Changes are “modest” but lead to significant changes in retrieved global aerosol
- New products: DB/DT merge, MxD04_3K, etc
- Documentation:
 - Algorithm papers have been published
 - ATBD in progress
 - Website under development
- C6 processing (Level 2) for Aqua almost finished. Terra begin soon? Level 3 soon?
- Validation (vs AERONET, MAN, etc) in progress
- Calibration/polarization/trending issues still being studied

Summary (Towards C7)

- Corrections for urban surface bias
- Development of “pixel level” uncertainty products
- Calibration/polarization/trending issues still being studied
 - Why is Terra offset from Aqua?
- Development of generic dark-target algorithm to be used on VIIRS, airborne and other spectral remote sensing datasets. (a Super C7).
